

Use Contract test to implement simulator JS WAY

```
describe('BetRepositoryMongoDb', () => {  
  let mongoClient: MongoClient;  
  let repository: BetRepositoryMongoDb;  
  
  beforeEach(async () => {  
    ...  
    repository = new BetRepositoryMongoDb(db);  
  });  
  
  afterEach(() => {  
    mongoClient.close()  
  });  
  
  betRepositoryContract(() => repository)  
})
```

```
describe('BetRepositoryFake', () => {  
  let repository: BetRepositoryFake;  
  
  beforeEach(async () => {  
    repository = new BetRepositoryFake();  
  })  
  
  betRepositoryContract(() => repository)  
})
```

```
export function betRepositoryContract(getRepository: () => BetRepository) {  
  test('register a bet', async () => {  
    ...  
  });  
  
  test('retrieve only bets inside the time range', async () => {  
    ...  
  });  
}
```

Exercise

Extract contract test and use it to implement simulator

```
var scrollHeight = element.clientHeight + 0.02 * window.innerWidth;  
window.scroll(0, scrollHeight);  
}
```
